# PARKER BURGESS

303-502-0155 | parkerburgess@outlook.com | San Antonio, TX | LinkedIn | GitHub | Personal Site

## PROFESSIONAL SUMMARY

Senior software engineer and former team lead with 14+ years building data-heavy products in C#/.NET, SQL Server, and Azure. Spent a decade at B3 Insight, an oil & gas water-data company, growing with it from founding-stage startup to established platform — from building the first product to setting technical direction for a 5-person team. Strongest where data quality, system design, and business priorities meet.

## SKILLS

**Languages:** C#, JavaScript, TypeScript, T-SQL, HTML/CSS
**Frameworks & Platforms:** .NET, ASP.NET, Blazor, Next.js/React, REST APIs, Aurelia
**Databases:** SQL Server, Azure SQL, Database Design, Performance Tuning, ETL
**Cloud & Tools:** Azure, Git, Jira, Confluence
**Leadership & Delivery:** Team Leadership & Mentoring, Hiring, Requirements, Project & Product Management

## EXPERIENCE

### Career Break — Travel & Independent Development

2024 – 2026

- Planned two-year travel sabbatical.
- Built a family of Next.js/TypeScript web apps backed by Azure SQL, including a standalone authentication service shared across the apps.

### B3 Insight

2014 – 2024

*Water and subsurface data platform for the oil & gas industry; joined at founding stage.*

**Lead Software Engineer – Team Lead** 2022 – 2024

- Promoted to lead a team of 5 developers, running day-to-day engineering: stand-ups, code reviews, ongoing team education, mentoring of junior developers, and management of infrastructure and tech debt.
- Owned most technical decisions company-wide and shaped the rest, spanning infrastructure and third-party vendors including Azure, SOC 2 contractors, and data providers.
- Headed the SOC 2 research and cost-benefit evaluation, which concluded certification wasn't worth pursuing, and co-led a company-wide security overhaul.
- Partnered with product leadership on project and product prioritization, weighing company-wide value, task scale, and resource availability to expand or scale back projects.
- Guided design and architecture decisions for the customer-facing product alongside its primary developer and drove the advanced map and data-filtering project.
- Retained full ownership of the internal data platform (all 3 apps and 9 pipelines) alongside lead responsibilities.

**Senior Software Engineer – Internal App Lead** 2019 – 2022

- Designed, built, and owned B3's internal data platform: three Blazor/SQL Server applications (Data Entry, Data Acceptance, Data Management), from initial requirements through data structures, development, deployment, and maintenance — as sole developer for the first two years.
- Built 9 stream-specific data pipelines covering Texas wells, Texas skim pits, New Mexico wells, and company ownership data, each with its own tables, business rules, automated tests, and data flow.
- Created a two-stage quality gate: double entry with automated comparison for manually processed Texas Railroad Commission H-1/H-1A/W-14 filings and review of third-party scraped skim-pit data, followed by automated test suites that routed issues into a correction workflow before data reached production.
- Developed data-management tools to standardize company names, construct ownership histories, assign owners to newly discovered wells, and apply corrections surfaced by ongoing research.

- Designed full change history from raw to production, so any record could be reverted to its raw state or reprocessed under new business rules.
- Managed 2 data-entry specialists and worked daily with 2 analysts, adapting rules and workflows as business needs changed; in the final year, trained and mentored a junior and a mid-level developer in the codebase.
- Led 2 company-name and ownership-history projects — one using Texas skim-oil records, one using public company records — that improved name quality across production data.

**Software Engineer – Business Support** 2016 – 2019

- Extended the core product (JavaScript front end, REST API, SQL Server) with new features, process improvements, and bug fixes.
- Analyzed raw data and business rules to build software for internal data-processing and data-quality workflows.

**Software Engineer – Product and Research** 2014 – 2016

- Explored several early-stage business ideas during the startup phase, working with subject-matter experts to gather, organize, and analyze data.
- Collaborated with the founding team to build the first version of the company's main product, contributing to design and feature development.
- Re-platformed the main product from ASP.NET to JavaScript/Aurelia as it matured.

### Adeptive Software 2013

***Software Developer***

- Resolved bugs in the company's main software product and supported customers directly by phone.

### BenTek 2009 – 2013

***Junior Software Developer***

- Built stored procedures, functions, triggers, and views to support application development.
- Wrote complex SQL queries to extract, analyze, and transform data across multiple databases.
- Wrote scripts to gather data from external sources.

## EDUCATION

**Bachelor of Science, Computer Science** — Regis University, Denver, CO 2009
